

ResumeFetch – LinkedIn Resume Retrieval Enhancement

Overview:

ResumeFetch is a feature enhancement designed for existing recruitment platforms that enables users to retrieve resumes already uploaded on their LinkedIn profiles through profile URL integration.

The feature aims to reduce repetitive manual uploads, improve user convenience, and streamline the overall job application process.

Problem Statement:

Job applicants often upload the same resume repeatedly across multiple recruitment platforms despite already maintaining an updated resume on LinkedIn. This repetitive process increases manual effort, causes inconsistencies between resume versions, and slows down the job application experience.

Proposed Solution:

Introduce the ResumeFetch feature, enabling users to paste their LinkedIn profile URL and automatically retrieve their uploaded resume for preview, verification, profile saving, and PDF download, eliminating the need for repeated manual uploads.

Key Features:

- LinkedIn profile URL validation
- Resume preview functionality
- Parsed information verification
- Save to Profile functionality
- Resume download capability
- Error handling for missing resumes
- Automated resume retrieval

Target Users:

- Job applicants

Expected Business Impact:

- Fewer abandoned applications at the resume-upload step
- Faster time-to-submit for candidates with an existing LinkedIn resume
- More current resume data on file, since it's pulled directly from LinkedIn instead of an old upload

ResumeFetch – LinkedIn Resume Retrieval Enhancement

Assumptions:

- Users have an updated resume uploaded to their LinkedIn profile.
- The candidate's LinkedIn profile is publicly accessible at the URL provided.
